

TOP 50 APEX QUESTIONS TO CRACK SALESFORCE INTERVIEW

#	Question	Impressive Answer
1	What is Apex in Salesforce?	Apex is a strongly-typed, object-oriented programming language developed by Salesforce for executing flow and transaction control on the Salesforce platform.
2	How is Apex different from Java?	Apex syntax is similar to Java but is designed to run in a multitenant environment and is integrated with Salesforce's data and security model.
3	What are Governor Limits in Apex?	Governor Limits control the resources used by Apex code (like SOQL queries, DML operations) to ensure fair resource usage across tenants.
4	What is a Trigger in Apex?	A Trigger is Apex code that executes before or after insert, update, delete, or undelete events on Salesforce records.
5	What is a Trigger.new and Trigger.old?	Trigger.new holds the new version of the record (for insert/update), and Trigger.old holds the previous version (for update/delete).
6	What is a Bulk Trigger?	A trigger designed to handle multiple records efficiently using collections, avoiding hitting governor limits.
7	What is SOQL?	Salesforce Object Query Language (SOQL) is used to fetch data from Salesforce objects like SQL.
8	What is SOSL?	Salesforce Object Search Language (SOSL) allows searching across multiple objects and fields with a single query.
9	Difference between SOQL and SOSL?	SOQL retrieves specific object records. SOSL performs text searches across objects.
10	What are Collections in Apex?	Collections are data structures (List, Set, Map) used to store groups of elements or records.
11	What is a List in Apex?	List is an ordered collection of elements, where duplicates are allowed.
12	What is a Set in Apex?	Set is an unordered collection of unique elements.
13	What is a Map in Apex?	Map is a collection of key-value pairs for quick lookups.
14	What is DML in Apex?	DML (Data Manipulation Language) operations like insert, update, delete, merge are used to manipulate Salesforce data.
15	How to avoid DML limits?	Use bulk-safe code, limit DMLs in loops, and batch operations when needed.

16	What is a Batch Class?	Batch Apex processes large data sets asynchronously in chunks using Database.Batchable interface.
17	What are the parts of a Batch Class?	start, execute, and finish methods.
18	What is a Future method in Apex?	Used to run asynchronous operations, especially for long-running tasks like callouts or DMLs.
19	When to use @future annotation?	When performing callouts or operations that should run after the current transaction completes.
20	What is a Queueable Apex?	It allows complex jobs to be added to the queue for asynchronous processing and is more flexible than future methods.
21	Difference between Future and Queueable?	Queueable allows chaining jobs and has better debugging, whereas future is simpler but limited.
22	What is Schedulable Apex?	It allows Apex classes to be scheduled to run at specific times using CRON expressions.
23	How do you schedule a class?	Implement Schedulable interface and use System.schedule() method.
24	What is a Wrapper Class in Apex?	A custom class used to group multiple data types or complex logic in a single unit.
25	What is the use of Custom Exceptions in Apex?	To handle specific business logic errors with meaningful messages.
26	What is the difference between public, private, and global in Apex?	private – accessible within class, public – accessible in namespace, global – accessible everywhere including managed packages.
27	What is a Test Class in Apex?	It is used to test the functionality and code coverage of Apex classes and triggers.
28	How to write a good Test Class?	Use @isTest, Test.startTest(), Test.stopTest(), assert logic, and cover positive/negative test cases.
29	What is code coverage?	Percentage of code lines executed during testing. Minimum 75% is required for deployment.
30	Can we perform callouts from Triggers?	No. Callouts must be done asynchronously via @future or Queueable.
31	What is the difference between Trigger and Workflow?	Triggers are code-based and more powerful, while workflows are point-and-click automation tools.
32	Can we call Apex from Flow?	Yes, using Apex actions in Flow with Invocable methods.

33	What is the purpose of the with sharing keyword?	It enforces the sharing rules of the current user.
34	What is without sharing in Apex?	It ignores sharing rules, often used in system-level logic.
35	Can Apex call REST APIs?	Yes, using Http, HttpRequest, and HttpResponse classes.
36	How to handle JSON in Apex?	Use JSON.serialize() and JSON.deserialize() methods.
37	What is Tooling API in Salesforce?	It lets you build custom development tools for Salesforce platform development.
38	What is the Apex Trigger Order of Execution?	System events like before triggers, validation, after triggers, workflows, assignment rules, etc., follow a specific order.
39	What is a Static Resource?	A file (JS, CSS, ZIP, image) uploaded to Salesforce used in Visualforce or Lightning.
40	What is an Apex Interface?	An interface defines method signatures which implementing classes must define.
41	Can Apex classes be abstract?	Yes, using the abstract keyword for partial implementations.
42	What are Apex Design Patterns?	Patterns like Singleton, Factory, and Strategy help build scalable and maintainable code.
43	How to handle large data volumes?	Use Batch Apex, Query optimization, indexing, and selective queries.
44	What are Limits class in Apex?	It provides methods to check resource usage like Limits.getQueries() or Limits.getDMLStatements().
45	What is dynamic Apex?	It refers to using Apex to create code that adapts at runtime using classes like Schema.
46	What is Schema class in Apex?	It provides metadata access, like object and field details, dynamically.
47	What is Apex Managed Sharing?	It allows developers to share records programmatically based on business logic.
48	What is a Custom Metadata Type?	It stores configuration data used by Apex or flows, deployable across orgs.
49	What is a Named Credential?	It simplifies authentication and callouts to external services.
50	What is @InvocableMethod annotation?	It allows Apex methods to be called from Flow, Process Builder, or another class.

#	Data Type	Size / Type	Typical Use	Syntax Example	Key Notes
1	Integer	32-bit whole number	Loop counters, age, quantity	Integer age = 25;	Range: -2.1B to +2.1B
2	Long	64-bit whole number	Large counters, file sizes	Long big = 1000000L;	Ends with L, range: very large
3	Double	64-bit floating point	Approximate decimals (e.g. temperature)	Double temp = 36.6;	Use for math, not for money
4	Decimal	High-precision fixed decimal	Currency, accounting, finance	Decimal price = 499.99;	More precise than Double
5	Boolean	Logical true/false	Conditions, flags	Boolean isActive = true;	Used in if, while, etc.
6	String	Text (sequence of chars)	Names, messages, IDs	String name = 'TCS';	Immutable, many built-in methods
7	Date	Calendar date only	DOBs, created dates	Date d = Date.today();	No time info, format: YYYY-MM-DD
8	Time	Time only	Clock, timers	Time t = Time.newInstance(14, 0, 0, 0);	No date info, format: HH:MM:SS.MS
9	Datetime	Full timestamp	Logging, schedules	Datetime dt = Datetime.now();	Includes both date and time
10	Id	15 or 18-char Salesforce record ID	Record references	Id accId = '0012x000003abcZAAQ';	Object-specific, prefix like 001 for Account
11	Blob	Binary data	Files, encryption, Base64	Blob b = Blob.valueOf('Text');	Used in attachments, can .toString()

Programming with Apex:-

```
System.debug('Hello World!');
```
