

Top 30 LWC Interview Questions and Answers (with Easy Explanation)

#	Question	Answer (with Simple Explanation)
1	What is LWC?	LWC (Lightning Web Components) is a modern UI framework to build reusable components in Salesforce using JavaScript and HTML.
2	Difference between LWC and Aura?	LWC uses modern JS (ES6+), better performance, and is lightweight. Aura is older, uses its own framework.
3	What are decorators in LWC?	@api, @track, and @wire — used to expose, track, and bind data in LWC.
4	What is @api?	Used to make properties/methods public so parent components can access them.
5	What is @track?	Marks a property to be reactive , so UI updates if the value changes.
6	What is @wire?	Automatically calls Salesforce Apex methods or services and binds the result to a property.
7	Lifecycle hooks in LWC?	constructor, connectedCallback, renderedCallback, disconnectedCallback. Used to handle component life events.
8	How to call Apex from LWC?	Import method using @salesforce/apex/ and call it using @wire or async/await.
9	How to pass data from parent to child?	Use @api in child component and pass value via attribute in parent's HTML.
10	How to pass data from child to parent?	Use Custom Events using this.dispatchEvent(new CustomEvent('eventname')).
11	How to navigate in LWC?	Use NavigationMixin from lightning/navigation.
12	How to show toast message?	Import ShowToastEvent from lightning/platformShowToastEvent.
13	Can we use SLDS in LWC?	Yes, it's auto-supported. Use SLDS classes in your HTML file.
14	How to handle forms in LWC?	Use <lightning-input>, track values with @track, and handle with JS functions.
15	Difference between imperative and wire service?	@wire is automatic and reactive. Imperative calls are manual and offer more control.

16	What is Shadow DOM in LWC?	A browser technology that encapsulates the component's structure, style, and behavior.
17	Can two LWC components communicate?	Yes, via Custom Events , pub-sub model , or Lightning Message Service (LMS) .
18	What is Lightning Message Service (LMS)?	Used for communication across components (LWC ↔ Aura ↔ VF) using a shared channel.
19	How to bind a list in LWC?	Use <code><template for:each={list} for:item="item"></code> to iterate and render list items.
20	What are dynamic components in LWC?	Components that are created/loaded dynamically at runtime using <code>lightning:isUrlAddressable</code> .
21	Difference between <code>connectedCallback</code> and <code>renderedCallback</code> ?	<code>connectedCallback</code> : component is inserted into DOM. <code>renderedCallback</code> : component is rendered.
22	What is <code>this.template.querySelector()</code> ?	Used to access DOM elements inside the template.
23	How to handle errors in LWC?	Use try-catch for imperative Apex, error object for <code>@wire</code> .
24	Can we use JavaScript Promises in LWC?	Yes, for handling async code like Apex calls or API fetch.
25	What is Lightning Data Service (LDS)?	Fetches and manages records without Apex, using base components like <code>lightning-record-form</code> .
26	What is <code>lightning-record-form</code> ?	A base component that auto-creates a form to view/edit/create records.
27	How to apply conditional rendering?	Use <code><template if:true={condition}></code> and <code><template if:false={condition}></code> .
28	What is a wire adapter?	A method that returns data (like Apex or LDS), and is used with <code>@wire</code> .
29	What is a custom label?	Reusable text values stored in Salesforce. Access using <code>import label from '@salesforce/label/namespace.LabelName';</code>
30	Can LWC work outside Salesforce?	No, LWC is tightly bound to the Salesforce platform, unlike other JS frameworks.
